**Description**

Welcome to the Innovator Fellow Pre-Application for .

**Innovator Fellows** are world-leading scientists and engineers who enter the program with a critical climate technology to commercialize. They commit full-time, without additional employment, to the entire two-year duration of the program, beginning in September 2023.

**What the Breakthrough Energy Innovator Fellowship Provides:**

- Substantial non-dilutive funding (roughly $500,000 to $3,000,000 per project) to support research and development costs, such as lab space, office space, equipment, supplies, technical consultants, staff and more to achieve pre-determined milestones
- Freedom to work anywhere within the regions where we operate
- A curriculum of intensive entrepreneurial training, mentorship, and networking opportunities
- Access to a robust network of industry partners to develop, validate, and demonstrate their technology as well as access to ecosystem of mentors, policy experts, investors, technologists, and government entities

The **full-time program** is designed to ensure early-stage entrepreneurs working on groundbreaking scientific solutions have the R&D funding, educational resources, and network access they need to realize the full potential of their work and begin to chart a path toward commercialization. In some cases, this may mean nurturing ideas until they are ready for venture capital investment, or enabling technology acquisition, non-traditional financing, government partnerships, or other pathways.

Our first two cohorts of Fellows are working on innovations within cement, steel, hydrogen, electrofuels, food and agriculture, long duration (seasonal) energy storage, carbon dioxide capture, storage, and sequestration, offshore wind, solar, advanced materials, and efficient building technologies. This year, we are looking for new innovations within those sectors as well as other hard to decarbonize sectors.
