Here's a quick overview of your process:

1. **Customer Interviews:** Gather insights from potential users to understand their needs and pain points.

2. ** :** Define and validate the problem you're aiming to solve.

3. **Ideal Customer Profile:** Create a detailed profile of your target customer to guide development.

4. **Requirements:** Define functional, non-functional, user, system, business, and regulatory requirements.

5. **Use Case:** Document scenarios that illustrate how users will interact with the software.

6. **Visual Drawings and Diagrams:** Develop visual aids such as wireframes, mock-ups, user flows, schema designs, ERDs, class diagrams, and user story maps.

7. **Development:** Build the software based on the defined requirements and designs.

8. **Release:** Progress through alpha, beta, release candidate, and stable release stages, gradually improving the product's polish and functionality.

9. **Testing:** Conduct various types of testing to ensure the software's quality and performance.

10. **Launch Preparation:** Prepare the software, documentation, marketing materials, and support channels for launch.

11. **Marketing & Launch:** Promote the software, generate interest, and officially release it to the market.

12. **Sales:** Begin selling the software to customers.

13. **Improvements:** Continuously gather feedback, make improvements, and iterate on the software to enhance its value.

Development Process

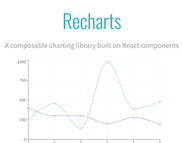

Based on the `package.json` file you provided, your app is using the following frameworks and libraries:

Frameworks:

1. **React:** A JavaScript library for building user interfaces.
   - `react`: The core library for building UI components.
   - `react-dom`: Used for rendering React components in the DOM.

UI Libraries:

2. **Material-UI:** A popular React UI framework following Google's Material Design guidelines.
   - `@mui/icons-material`: Icons library for Material-UI.
   - `@mui/material`: Core Material-UI components and styles.
   - `@mui/styled-engine-sc`: Styling solution for Material-UI using styled-components.

3. **PrimeReact:** A suite of rich UI components for React applications.
   - `primeicons`: Icons library for PrimeReact components.
   - `primereact`: PrimeReact UI components.

Styling Libraries:

4. **Emotion:** A CSS-in-JS library for styling React components.
   - `@emotion/react`: Emotion library for styling.
   - `@emotion/styled`: Styled components with Emotion.

5. **Styled-Components:** A popular CSS-in-JS library.
   - `styled-components`: Library for writing CSS within JavaScript using components.

Charting Library:

6. **Recharts:** A charting library for creating interactive and customizable charts in React applications.
   - `recharts`: Library for creating charts.

Utility Libraries:

7. **axios:** A promise-based HTTP client for making API requests.
   - `axios`: HTTP client library.

8. **dayjs:** A library for working with dates and times.
   - `dayjs`: Date and time manipulation library.

Other Libraries:

9. **Firebase:** A platform for building web and mobile applications.
   - `firebase`: Firebase services and features.

10. **Miscellaneous:**
    - `@google-cloud/aiplatform`: Google Cloud's AI Platform APIs.
    - `@google-cloud/bigquery`: Google Cloud's BigQuery APIs.
    - `mui-calendar-picker`: A calendar picker component for Material-UI.
    - `emailjs-com`: Package for sending emails.
    - `web-vitals`: Package for measuring web performance metrics.

The dependencies in your `package.json` file indicate that your app uses a combination of React, Material-UI, PrimeReact, Emotion, Styled-Components, Recharts, axios, dayjs, and various other packages. This suggests that your app likely focuses on building interactive user interfaces, data visualization, and potentially involves integrations with APIs and back-end services.
